

CARTON: WHAT IT DOES

- Declare your application dependencies in a file named `cpanfile`
- Install application dependencies with `carton install`
- Run your application with `carton exec -- bin/app`

CARTON: HOW IT WORKS

- `carton install` reads `cpanfile` and compares installed module versions with declared dependencies
- `carton` installs (or updates) any missing (or out-of-date) modules using `cpanm`
- `carton exec` adds `$PWD/local/lib/perl5` to the `PERL5LIB` environment variable
