PLENV USAGE: USING A NEW PERL

```
$ mkdir project-2

$ cd project-2

$ plenv local 5.26.2

$ perl -v
This is perl 5, version 26, subversion 2 (v5.26.2)
…
```

NOTE: NOT FOR PRODUCTION

- `plenv` is a development tool that allows you to change which version of Perl you are working with by manipulating your `$PATH` and clever shell wrappers for existing Perl binaries.

- You don't want to do anything like this in production: just use the right version of Perl and keep your default shell setup.
